

# DentaKOTE™

Effectively Taking a Bite Out of Dental Disease

DentaKote minimizes the damaging effects of the oral bacteria toxins. This helps reduce the inflammation around your prosthesis and implants.

## DentaKote for Caring Dentists

**DentaKote** - Advanced Biopolymer Developed by a Dentist

**DentaKote** - Gel material that bonds instantly to hard surfaces in the oral cavity and to dental appliances.

### DentaKote is:

- Clear, odorless, and colorless
- It provides a non-stick surface against all oral bacteria and debris
- Once applied, it is only one micron thick
- It bonds instantly
- Ablation occurs only through continuous abrasion
- Oral cavity persistence can range from 6-12 months before reapplication is needed
- It is usually applied by the hygienist or dentist intraorally, labs can apply to all prosthesis prior to delivery.
- It comes in a preloaded brush, with enough material to easily cover both upper and lower arches
- This is especially critical with implants, as most implant failure is the result of bacterial infection

### Ideal Applications:

- Apply to exposed surface of Dental implants (prevent bacterial attachment and failure)
- Dental Lab recommended, coat all appliances from Dentures to aligners
- Especially important for hybrid restorations to help to prevent the bacterial attachment to these devices
- DentaKote material is FDA accepted for all dental applications intraorally, all dental restorations, and on all dental materials.

**A great service for the patient and an additional revenue source for the dental practice.**
